a **Accuracy and paired conformational change**

Dots: systems; box: IQR; white diamond: mean and 95% CI

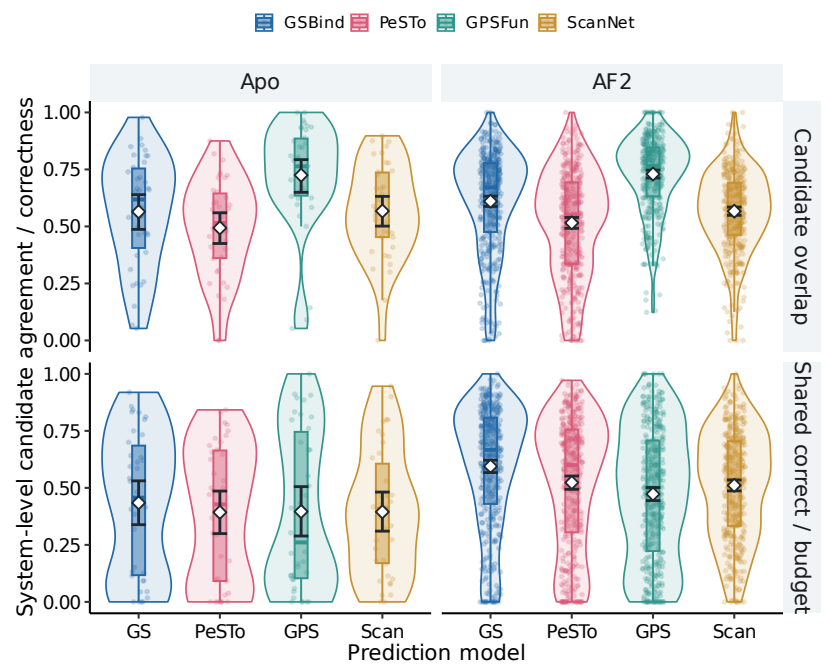

b **Accuracy across interface deformation**

All cases; red: system estimates in fixed bins (95% CI)

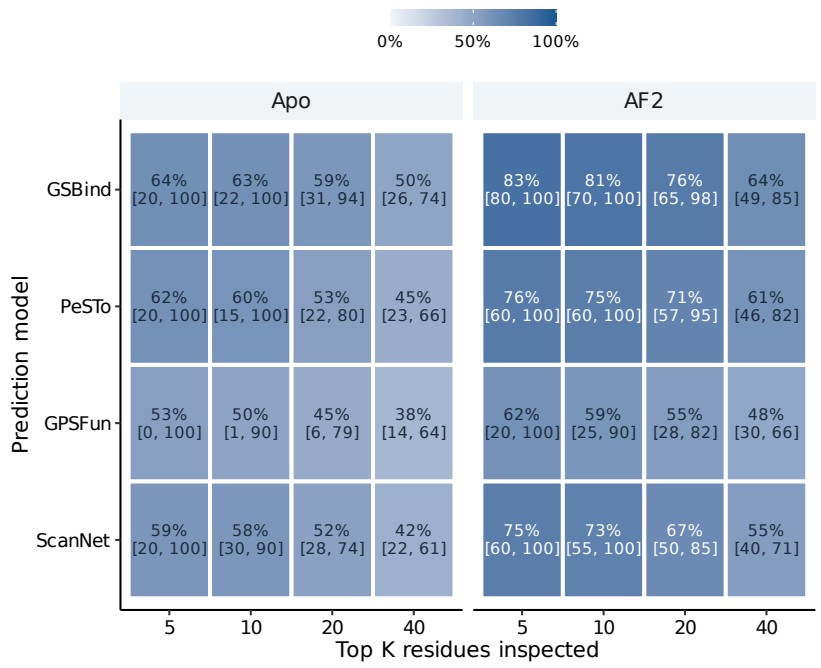

c **Stable recommendations must be correct**

Top-10% budget: overlap versus retained true interface hits

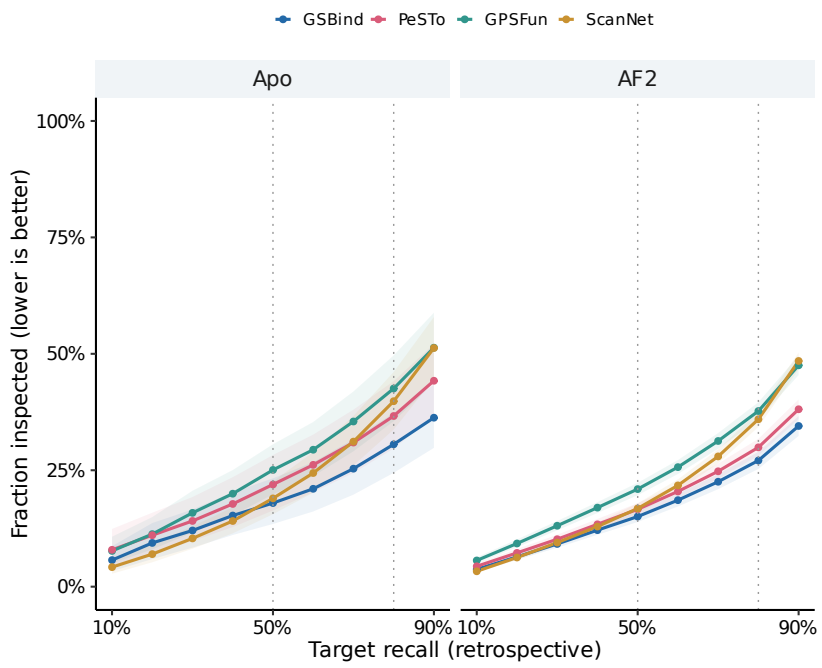

d **Fixed-budget yield and heterogeneity**

Each cell: system-mean precision; [system IQR, %]

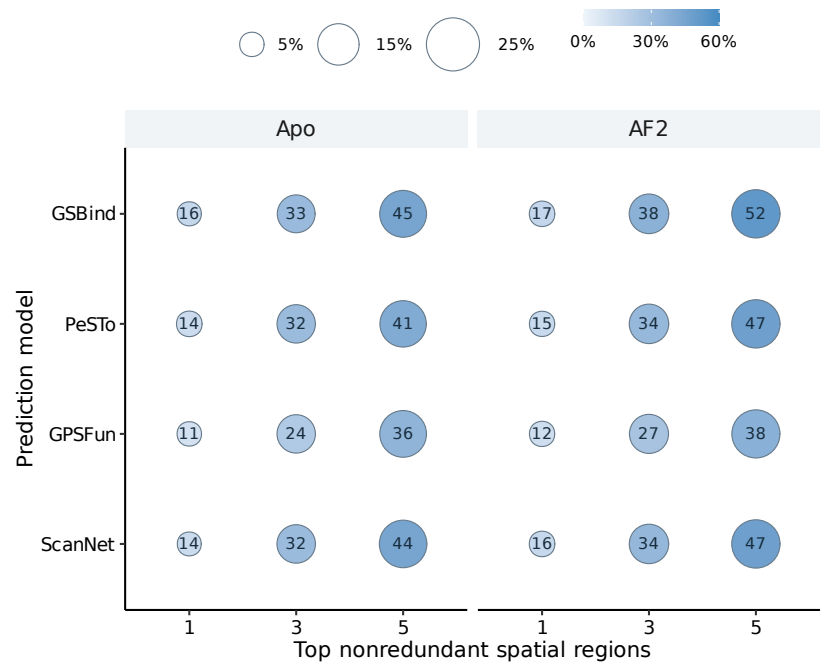

e **Less screening for interface coverage**

80% recall: AF2 9.4%; Apo 16.6% less than PeSTo

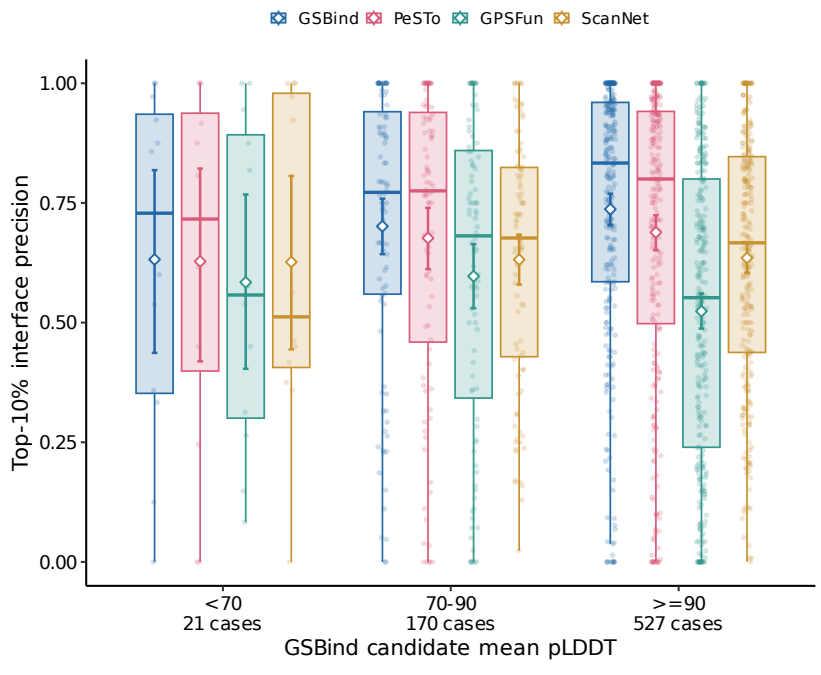

f **Spatial localization versus search area**

Number: recall (%); bubble area: actual residue fraction

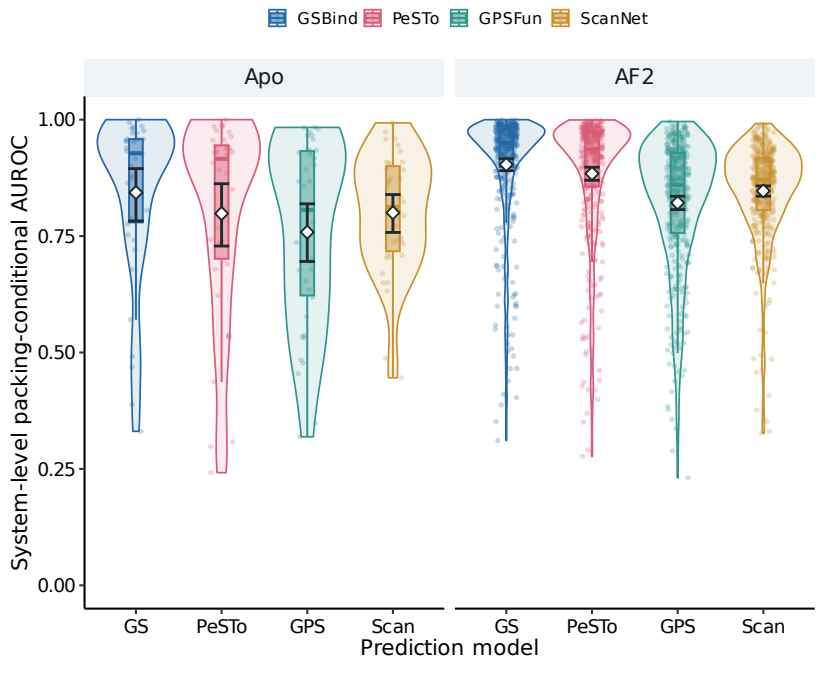

g **Structure confidence contextualizes hits**

Common case groups; confidence is not binding probability

h **Binding selectivity at similar packing**

Compare only positive-negative pairs within packing strata

i **Accuracy and screening gains coincide**

Blue: both better; one dot per system; all systems retained
